A study of the lithium-carbon system was made in terms  
of thermal analysis. The preparation of melt and the  
recording of cooling curves were done in argon atmos-  
phere. The structural phase diagram of the system for  
the stage between lithium and lithium carbide ( $\text{Li}_2\text{C}_2$ )  
was determined. Lithium and lithium carbide form a  
eutectic whose composition lies nearly to pure lithium  
(carbon content was less than 1 atomic %); the eutectic  
point was about 165°C. By means of the boiling point

The measuring of the sample current in the Castaing  
microprobe permits evaluation, under determined con-  
ditions, of the back-scattered and secondary emission  
of electrons  $\eta$  and  $\Delta$  at the point of impact of the elec-

The course of decomposition of xanthates of mono- and polyhydric alcohols (ethanol, 1-4-butanediol, 1-3-butanediol, ethylene glycol, glycerine) as well as of monomeric sugars (glucose, xylose) in aqueous solution was investigated in a wide pH-range (pH 4.6 to 7 n NaOH), and compared with the process of decomposition of dilute solutions of pure cellulose xanthate. Considering earlier results of our own investigation as well as the work published by other authors, the mechanism of decomposition is discussed for the various
